Chemical Spill-10 2011 Summary Letter Report

Dear Mr. Davis:

The purpose of this Summary Letter Report (SLR) is to document the results of sampling activities conducted at the Chemical Spill-10 (CS-10) plume under the System Performance and Ecological Impact Monitoring (SPEIM) program during the 2011 calendar year. This deliverable does not contain a detailed assessment or evaluation of the results, but is a means of documenting all the actions completed under the CS-10 SPEIM program. The data collected under the SPEIM program are continually assessed and the results of these assessments are presented initially during the Technical Update Meetings, and then through Technical Memoranda or Project Note deliverables if warranted, based on the results of the data evaluation or to address particular plume issues.

This letter report includes a summary of the activities performed and the data collected for the CS-10 SPEIM program between 01 January 2011 and 31 December 2011. The contaminants of concern (COCs) for the CS-10 plume are the volatile organic compounds (VOCs) trichloroethene (TCE) and tetrachloroethene (PCE). The CS-10 plume is defined by the extent of groundwater containing TCE and/or PCE at concentrations above the Maximum Contaminant Level (MCL) of 5 micrograms per liter (µg/L) for each compound. Three systems were designed to remediate the CS-10 plume: (1) the CS-10 Sandwich Road extraction, treatment, and reinjection (ETR) system which consists of eight closely-spaced extraction wells for the Sandwich Road plume, a Southern Trench extraction well, four granular activated carbon (GAC) treatment trains within the Sandwich Road Treatment Facility (SRTF), and six reinjection wells; (2) the CS-10 In-Plume (IP) extraction, treatment, and infiltration (ETI) system which consists of nine extraction wells located within the body of the plume, four GAC treatment trains within four treatment plant buildings, two infiltration trenches, and a reinjection well; and (3) the CS-10 Northern lobe extraction well which utilizes the SRTF and the Storm Drain-5 (SD-5) North reinjection wells. The CS-10 plume, treatment systems, and components are presented in **Figure 1**.

In 2009, the Air Force Center for Engineering and the Environment (AFCEE) finalized the Record of Decision (ROD) for the CS-10 groundwater plume which includes the CS-10 IP, CS-10 Sandwich Road, CS-10 Northern lobe and the other CS-10 leading edge lobes. The *Final Record of Decision for Chemical Spill-10 Groundwater* (AFCEE 2009b) documents the

selected remedy for CS-10 groundwater which includes continued operation of the current CS-10 remedial systems, installation of an additional extraction well (03EW2112) and reinjection well (03RI2112) to address contamination in the Southern Trench area, long term monitoring (LTM) for the North Central lobe, Southern lobe and the area located on the east side of Johns Pond, and implementation of land use controls (LUCs). A Final Explanation of Significant Differences was submitted in September 2011 that clarified the inclusion of monitored natural attenuation (MNA) as a component of the selected remedy, slightly modified the phrasing of the remedial action objectives, and updated the steps to achieve site closure (i.e., the three-step process) (AFCEE 2011a).

CS-10 SPEIM ACTIVITIES

The SPEIM program was developed to monitor plume changes and to ensure the effective operation of the AFCEE groundwater remediation systems at the Massachusetts Military Reservation (MMR). These objectives are met through monitoring of selected media (i.e., groundwater, surface water) within and outside the plume boundaries, treatment plant monitoring, and groundwater flow and transport modeling. Activities completed for the CS-10 SPEIM program during 2011 include the following:

SPEIM Sampling Activities:

- Biennial groundwater sampling (January 2011 to April 2011). Data collected between September 2010 and December 2010 are included in the CS-10 2010 SLR (AFCEE 2011e).
- Semiannual extraction well sampling (August 2011 and December 2011).
- Annual groundwater sampling (November 2011 to December 2011). Note that the annual sampling event was not completed in December 2011; seven locations were sampled in January 2012 but they are included in this 2011 SLR for completeness.
- Baseline sampling of 84 newly installed monitoring wells (May 2011 to October 2011) to support the CS-10 data gap investigation.
- A one-time sampling of 39 IP area monitoring wells, six Sandwich Road area monitoring wells (June/July 2011), and two additional Sandwich Road area monitoring wells (January 2011) to support the CS-10 data gap investigation.
- Synoptic water level measurements were collected from 187 monitoring locations (October 2011) to support the CS-10 groundwater flow model recalibration.
- Sampling of extraction wells 03EW2176 and 03EW2177 (January 2011 to December 2011) to support an optimization evaluation. The sampling frequency went from weekly to biweekly to monthly in 2011.
- Seasonal recreational beach area surface water sampling. (April 2011 and July 2011).
- Monthly treatment plant sampling (January 2011 through December 2011).
- Recording of daily average treatment system flow rates (January 2011 through December 2011).
- CS-10 Northern Lobe Extraction Well 00EW0001 – Influent samples were collected from extraction well 00EW0001 at increasing flow rates as part of an optimization evaluation (January 2011 to December 2011).

- In Situ Chemical Oxidation (ISCO) Pilot Test - Two groundwater sampling events (April 2011 and July 2011).
- Cyclic Pumping Test at 03EW2110 – Began cyclic pumping test at 03EW2110 on 24 January 2011. Influent samples for VOC analysis were collected 1 hour, 48 hours, and one week after system startup and at the end of each month of operation.

The groundwater and surface water locations sampled for the CS-10 SPEIM program in 2011 are presented in **Figures 2**, **3**, and **4**. Well construction and surface water sample location information is included in **Table 1**. The current approved CS-10 SPEIM network, including the analytical scope and methods, is presented in the *Comprehensive Long Term Monitoring Plan*, which is available from AFCEE.

Groundwater analytical results for the COCs are summarized in **Table 2**. Three wells were also sampled for ethylene dibromide (EDB) because concentrations at these locations had previously exceeded the Massachusetts Maximum Contaminant Level (MMCL) of 0.02 µg/L for EDB. Groundwater analytical results for EDB are summarized in **Table 3**. Surface water analytical results are summarized in **Table 4**. Maps showing the distribution of COC detections in groundwater are presented in **Figures 5**, **6**, and **7**. Hydraulic monitoring locations are listed in **Table 5** and are presented in **Figure 8**. A comparison of compounds detected in groundwater and treatment plant samples to applicable standards is included in **Attachment A**.

Drilling Activities:

- CS-10 Direct Push and Rotosonic Drilling Program – Thirty-four direct push borings (03DP1104 through 03DP1133 and 03DP2014 through 03DP2017) and 12 rotosonic borings (03MW1078A through 03MW1089A) were completed between January 2011 and December 2011 to further evaluate the extent of contamination in the northern portion of the CS-10 IP area and in the area north of Sandwich Road extraction wells 03EW2176 and 03EW2177. Groundwater vertical profile samples were collected at 10-foot intervals for VOC analysis at each of the direct push borings and rotosonic borings (**Attachment B**). Two or three monitoring well screens were installed at each of the 12 rotosonic borings for a total of 35 monitoring wells. Continuous soil samples were collected from the water table to bedrock for lithologic classification at each rotosonic boring; selected samples from major lithologic units were analyzed for total organic carbon (TOC) and grain size. These data were collected to support optimization of the CS-10 IP and Sandwich Road remedial systems to improve system performance.

Drilling locations and newly installed monitoring wells are presented in **Figure 9**. Groundwater vertical profiling results are included in **Attachment B** and the distribution of COC detections based on groundwater vertical profiling results are presented in **Figure 10**. Location and well construction information are included in **Table 1**. Well construction diagrams, soil boring logs, and water boring logs will be included in a future technical memorandum.

Data Summary Report:

The data summary report for the analytical data reported in this SLR is included in **Attachment C**.

Presentations:

Presentations completed for the CS-10 plume are listed in **Table 6**.

Project Note Submittals:

The project notes related to activities conducted for the CS-10 plume under the SPEIM program in 2011 are included in **Attachment D**.

Report Submittals:

- *Chemical Spill-10 2010 Summary Letter Report* submitted in March 2011 (AFCEE 2011e).
- *GSI Matrix Diffusion Study – Results from Pilot Test Location 03BH1060/03GB1060 Project Note* submitted in February 2011 (AFCEE 2011f).
- *GSI Matrix Diffusion Study – Results from Second Pilot Test Location 03DP2000/03BH2000 Project Note* submitted in May 2011 (AFCEE 2011d).

Major Events and Optimizations:

Optimization activities are completed as part of the SPEIM program in order to improve the performance of the remedial systems and to improve the monitoring program. Data gap investigations are also completed when warranted.

In-Plume Data Gap Investigation

The current operating scenario for the CS-10 IP remedial system is meeting the design goals and achieving the remedial action objectives but transport modeling results predict long restoration timeframes (i.e., >2055). Results of SPEIM data evaluation (extraction well influent concentrations and monitoring well results) indicated the potential to optimize the performance of the IP extraction wells but additional data collection was necessary. A data gap investigation, designed to provide the information needed to optimize the northern CS-10 IP extraction wells, was initiated in 2008 and continued through 2011. Refer to the Drilling Activities section for details of the data collection activities conducted in 2011.

Initial results from this investigation led to the optimization of 03EW2110; the top 50 feet of this well screen was blocked with a packer in July 2009 to increase mass removal efficiency (AFCEE 2009a) and supported an interim shutdown of 03EW2106 on 24 February 2010 (AFCEE 2010b). Data collected was also used to design a cyclic pumping test for 03EW2110 that was initiated in January 2011 and is currently ongoing.

The data collected during this investigation will be used to update the conceptual site model (CSM) for CS-10, recalibrate the CS-10 groundwater flow model, and update the 2007 TCE plume shell. Groundwater flow and transport modeling will be used to evaluate optimization scenarios for the CS-10 IP remedial system. Other sampling efforts designed to enhance the data set for updating the CSM and the model include the following:

- Soil samples collected from sonic borings were submitted for TOC analysis. These TOC data will be used to assess whether the groundwater model transport parameters should be varied spatially across the model domain.
- A range of geophysical methods were assessed with the goal of determining the distribution of lower hydraulic conductivity units in the aquifer. Natural gamma and electromagnetic (EM) logging of existing monitoring wells were determined to be the most suitable, versatile, and effective techniques with the potential to identify the location of fine-grained lithologic units adjacent to existing monitoring wells. These techniques are easy to use, relatively low cost, the logging equipment can be used in 2-inch or larger

wells, and many wells can be logged relatively quickly. A pilot test of geophysical logging techniques (natural gamma and EM induction) was completed in September 2010. Three existing monitoring wells were logged using both techniques. The locations were selected based upon the well screen depth and the variation of lithology (i.e., the presence of finer grained silt and clay units), as determined by continuous soil sampling and grain size analysis, and the percentage of soil core recovery retrieved during sampling. Data collected during this pilot test indicate that the geophysical logging techniques tested have the potential to provide useful information about the subsurface geology at well locations where no detailed lithologic information was collected during drilling. Geophysical logging using natural gamma radiation and EM conductivity was able to identify, with mostly successful results, the presence and approximate extent of several fine-grained units (e.g., silty-sand, silt, and clay lithologic units) within the three existing locations selected for this pilot test. A project note documenting the findings and recommendations was submitted in December 2011 (**Attachment D**).

Optimization of Southern Trench Extraction Well 03EW2112

Extraction well 03EW2112 began operation in February 2009 at the pumping configuration described in the *CS-10 2008 Southern Trench System Optimization Project Note* (AFCEE 2009c). Plume and performance monitoring data indicated the leading edge of the CS-10 plume in this Southern Trench area had not yet reached the extraction well and the well was temporarily turned off in April 2009. A field program to help determine when the leading edge of the plume had migrated to 03EW2112 and to collect the data needed to evaluate optimized scenarios for the operation of 03EW2112 was initiated in 2009 and continued through 2010 (AFCEE 2010c and 2011e). A focused update of the 2007 TCE plume shell for the Southern Trench area was completed using more recent 2010 results. This updated plume shell was used with the CS-10 2007 groundwater model to predict system performance and plume migration for various operational scenarios for 03EW2112. A proposed operating scenario for 03EW2112, which included a flow rate of 100 gpm with a packered configuration, was presented to the regulatory agencies at the 15 December 2010 Technical Update Meeting; the agencies agreed with the recommendation and 03EW2112 began operating at the optimized scenario on 19 January 2011. Sensitivity modeling was completed in 2011 to determine the appropriate CS-10 Sandwich Road reinjection scenario with this revised flow rate at 03EW2112, with the objective of minimizing hydraulic impacts on nearby areas of concern including the U.S. Geological Survey (USGS) Tracer Test Site and the phosphorus plume associated with the operations of the former MMR Sewage Treatment Plant. Recent changes to the operating conditions at the CS-10 Sandwich Road extraction fence (i.e., turning on 03EW2176 in June 2011 and 03EW2177 in January 2011) were also evaluated as part of this optimization. A report summarizing the field program and modeling evaluation completed for this optimization, and recommendations for the Sandwich Road reinjection scenario, is scheduled for submittal in March 2012.

Optimization of In-Plume Extraction Well 03EW2110

A plan to evaluate a cyclic pumping scenario at 03EW2110 was presented to the regulatory agencies at the 15 December 2010 Technical Update Meeting. Modeling efforts to support the cyclic pumping plan included the completion of a localized TCE plume shell, contaminant transport modeling, and model projected mass removal estimates. The cyclic pumping test at 03EW2110 began on 24 January 2011; the test was designed to cycle operation of 03EW2110 on a two-month frequency at a flow rate of 250 gpm. Influent samples for VOC analysis were collected 1 hour, 48 hours, and one week after the startup of the well and at the end of each

month of operation. Results will be used to determine if similar mass removal rates can be achieved at reduced energy costs and greenhouse gas emissions when compared to full time operation. An evaluation of contaminant rebound effects after shut down periods will also be assessed during the pilot test. Results from the first cycle were presented to the agencies at the 13 July 2011 Technical Update Meeting. Rebound effects were short-lived; TCE influent concentrations returned to pre-shutdown levels within 48 hours. The cyclic pumping test will be ongoing through 2012; evaluating if flow rate reductions improve performance. Results will be reported at the Technical Update Meetings.

Optimization of Northern Lobe Extraction Well 00EW0001

Increasing TCE influent concentrations collected from 00EW0001 and increasing concentrations in upgradient monitoring wells identified the potential for optimization of 00EW0001. Flow testing at progressively increasing flow rates was completed in 2009 to determine if the flow rate could be optimized to improve performance and the design flow rate was increased from 175 gpm to 190 gpm in December 2009. TCE influent concentrations continued to increase from 44 µg/L (December 2009) to a maximum of 70 µg/L (April 2010). A second flow test was completed between August 2010 and March 2011 at the maximum achievable flow rate with the current pump and motor, 210 gpm. TCE influent concentrations fluctuated but remained relatively high, ranging from 44 µg/L to 62 µg/L. The pump and motor were replaced in March 2011 and a third flow test was conducted at a flow rate of 225 gpm. TCE influent concentrations ranged from 45 to 65 µg/L at this higher flow rate (225 gpm), which was relatively consistent with influent concentrations observed with the well operating at 210 gpm. Results were presented to the regulatory agencies at the 29 September 2011 Technical Update Meeting and it was recommended that 00EW0001 continue operating at the higher flow rate of 225 gpm until TCE influent concentrations continually decrease (**Attachment D**).

Monitoring Network

Recommendations for optimizing the CS-10 SPEIM/LTM network were presented at the Technical Update Meeting on 29 September 2011. These revisions included (i) reducing the sampling frequency of Southern Trench area wells from semiannual to annual; (ii) increasing the sampling frequency at 00MW0584A (located on the east side of Johns Pond) from biennial to annual, and (iii) adding 03MW2412A,B (located downgradient of the Sandwich Road ETR system) to the network for semiannual sampling. These network revisions were documented in the *CS-10 2010/2011 Biennial SPEIM/LTM Data Presentation (October 2010 through April 2011) Project Note* which was submitted in January 2012 (**Attachment D**).

Sandwich Road Extraction Wells 03EW2176 and 03EW2177

Two off-line Sandwich Road extraction wells (03EW2176 and 03EW2177) were turned back on in 2011 after TCE MCL exceedances were observed in 03EW2177 (during sampling of the off-line well). Extraction well 03EW2177 was restarted on 10 January 2011 at 50 gpm. Adjacent off-line extraction well 03EW2176 was restarted on 23 June 2011 at 50 gpm and the flow was increased to 75 gpm on 06 July 2011 to improve plume containment at Sandwich Road after observing MCL exceedances in downgradient monitoring well 03MW2412A (41.5 µg/L). Data gap investigation activities completed in this area in 2011 included monitoring well sampling, extraction well sampling, the completion of six direct push borings and one rotosonic boring, and the installation of three monitoring wells. In addition, a capture zone analysis was completed for various operating scenarios for 03EW2176 and 03EW2177 using the 2007 CS-10 groundwater flow model. The modeling indicated that upgradient TCE

contamination would be captured with 03EW2176 and 023EW2177 operating at the interim flow rates of 75 and 50 gpm, respectively. Additional sampling is planned for 2012 and once the contamination in this area has been better defined, optimization of the Sandwich Road system will be completed using the revised TCE plume shell and the recalibrated groundwater flow model as part of the CS-10 IP optimization modeling effort.

ISCO Pilot Test

Sampling of selected ISCO pilot test wells continued in 2011 to further evaluate the migration and persistence of permanganate and for further evaluation of TCE, total dissolved solids, dissolved manganese, dissolved chromium, and dissolved hexavalent chromium concentration trends (AFCEE 2010a). Two supplemental sampling events were completed in April and July 2011.

Matrix Diffusion Pilot Study

A pilot test to evaluate matrix diffusion effects from contaminant mass located in low permeability zones on groundwater concentrations in the CS-10 plume was initiated in November 2009. This study was completed with GSI Environmental Inc. (GSI) and the University of Guelph (UG). The primary objective of this evaluation was to determine if contamination has diffused and/or sorbed into the low permeability zones creating "secondary sources" of contamination in the CS-10 plume that may impact CS-10 remedial system operating and/or restoration timeframes.

The area upgradient of CS-10 IP extraction well 03EW2102 was selected for the matrix diffusion pilot study because consistently high TCE influent concentrations have been detected at 03EW2102 since system startup and relatively high TCE concentrations (greater than 1,700 µg/L) were detected in this area. The field program was completed in December 2009 and a summary report was submitted in February 2011 (AFCEE 2011f). The data obtained did not provide clear confirmation of the proposed conceptual model that contaminant mass has migrated into a lower permeability unit and is diffusing back into higher permeability zone at this one location. The inability to obtain undisturbed soil cores in the silt at this location also limited the ability to definitively eliminate this as a relevant process. Data collection efforts were modified and a second site was selected for further evaluation.

This second location, at the ISCO pilot test site, more closely matched the conceptual model for matrix diffusion from a lower permeability zone since the maximum concentrations in the area of the second site (near 03MW1024A) were detected in the lower permeability zone. The field program was completed in November 2010 and a summary report was submitted in May 2011 (AFCEE 2011d). VOC soil results confirmed that TCE mass is present and possibly stored in the thick lower permeability silt units at this location. Modeling simulations completed by the GSI/UG team predict that elevated TCE concentrations persist within the lower permeability silt zone for extended periods, however, TCE concentrations in the upper sand unit declined to less than the MCL of 5 µg/L within a few years. This suggests that although contamination may be located in lower conductivity zone, it may not constitute a significant secondary source of contamination. The contribution from back diffusion at this site is likely countered by relatively rapid groundwater flow within the upper sand unit.

Equivalent porewater concentrations estimated using the soil VOC data were consistent with the groundwater TCE concentrations at the second pilot test location indicating that groundwater data can be used as an indicator of soil contamination in a silt zone and can provide information on the potential for matrix diffusion at a site where high concentrations

are detected in a silt zone. Site conditions at the second location, where the high TCE concentrations (greater than 300 µg/L) are detected in a low permeability silt unit, are not representative of conditions across the CS-10 plume. Based on results collected to date during the ongoing CS-10 data gap investigation, the highest TCE concentrations are located within fine sand units, rather than lower conductivity silt units.

Alternative GAC Products Pilot Test

A pilot test to compare the performance of three different granular activated carbon (GAC) types versus the reactivated coal-based GAC product currently used at AFCEE's MMR groundwater treatment facilities was performed at CS-10 IP Building D from 26 January 2010 to 23 May 2011. The objective of this test was to determine if alternative GAC products exhibit longer bed lives than the currently used reactivated coal-based product. Results indicated that virgin coconut shell GAC outlasted custom segregated regenerated (CSR) GAC by a factor of two (AFCEE 2011c). Based on these encouraging results, AFCEE purchased a 20,000-pound (lb) load of virgin coconut shell-based GAC for use in a comparative test at CS-10 IP Building D. This bed lasted seven months in the lead position. For comparison, since January 2009, the average service life of a bed of CSR GAC once it is moved to the lead position is 2.3 months; over this period, a bed of CSR GAC has never lasted more than four months in the lead position. A 20,000-lb load of coconut shell GAC and a load of reactivated product are currently being tested at CS-10 IP Building D.

GAC Regeneration Testing

A pilot test to evaluate potential processes for on-site regeneration of spent GAC was performed at CS-10 IP Building D from 17 February 2010 to 05 July 2011. Loads of spent GAC produced in the pilot columns were regenerated by two methods at off-site facilities; microwave and hot water desorption. The regenerated GAC was reloaded into the pilot columns and performance was compared to fresh GAC. Results indicated that the microwave-regenerated GAC removed TCE to below detectable levels, but the hot water regenerated GAC did not. Subsequently, a drum of spent GAC was regenerated by the microwave process in order to gather data to perform a sustainability analysis of the process (AFCEE 2011b). It was found that the total greenhouse gas emissions per pound of GAC were higher than emissions associated with off-site thermal reactivation when the source of electricity is local grid power. However, if power is obtained from renewable electricity generation, emissions of the microwave regeneration process could be far lower than the natural gas-fired thermal reactivation process coupled with long distance round-trip shipping by diesel fueled trucks. It was recommended that results of previous work funded by AFCEE be made available to other government agencies for a possible Broad Agency Announcement solicitation.

Pilot Testing of Injecting Oxidizing Chemicals

The potassium permanganate ($KMnO_4$) injection system at the CS-10 Sandwich Road Treatment Facility (SRTF) was reactivated to determine if $KMnO_4$ injections would result in a cost-effective means of reducing GAC consumption and overall treatment costs by lowering contaminant concentrations in the influent stream entering the GAC vessels. Results of the testing indicated that the use of $KMnO_4$ to reduce TCE concentrations is not likely to provide any cost benefit compared to the use of GAC alone. Due to unfavorable reaction kinetics and the limited residence time in the treatment system, the amount of $KMnO_4$ required to produce any significant reduction in GAC consumption is very high, resulting in high operating costs in comparison to the use of GAC alone for removal of TCE. A project note summarizing these

results was submitted in December 2011 and is included in **Attachment D**. Additional limited testing is scheduled to be performed in 2012 to verify initial results.

CS-10 REMEDIAL STATUS UPDATE

Analytical results from the CS-10 IP Treatment Plants and the CS-10 SRTF are presented in **Tables 7a**, **Table 7b**, **Table 7c**, **Table 7d**, and **Table 8**, respectively. Average weekly flow rates for the CS-10 IP extraction wells, reinjection well, and infiltration trenches are presented in **Table 9**. Average weekly flow rates for the CS-10 Sandwich Road extraction and reinjection wells, the Southern Trench extraction well, the CS-10 Northern lobe extraction well, and the SD-5 North reinjection wells are presented in **Table 10**. Treatment system operational downtimes or deviations (for events lasting two hours or longer) between January and December 2011 are summarized in **Table 11**. Mass removal calculations through December 2011 for the CS-10 IP Treatment Plants, SRTF, and the CS-10 Northern lobe extraction well are presented in **Table 12**, **Table 13**, and **Table 14**, respectively.

The most recent documented plume shells for the CS-10 plume include: (1) data collected through December 2007 for the TCE plume shell for the main body (includes IP and Sandwich Road areas) of the CS-10 plume (AFCEE 2009c), (2) data collected through January 2007 for the PCE plume shell for the main body of the CS-10 plume (AFCEE 2008), and (3) data collected through April 2005 for the TCE plume shell for the CS-10 leading edge lobes (AFCEE 2005). The mass and volume statistics reflect dissolved-phase contamination at concentrations above the MCL.

The December 2007 plume shell for the main body of the CS-10 plume is estimated to contain 1,121 lbs of dissolved-phase TCE. However, data collected as part of the ongoing CS-10 data gap investigation indicated that this is an underestimation. The January 2007 plume shell for the main body of the CS-10 plume is estimated to contain 70 lbs of dissolved-phase PCE. The volume of contaminated groundwater in the main body of the CS-10 plume is estimated to be approximately 4.4 billion gallons of TCE and 0.37 billion gallons of PCE. Since the PCE plume is primarily located within the larger TCE plume, the total volume of contaminated groundwater for the main body of the CS-10 plume is close to the 4.4 billion gallons reported for TCE.

The April 2005 TCE plume shell dissolved-phase mass and volume estimates for the CS-10 leading edge lobes are 45.9 lbs and 87.5 million gallons for the Northern lobe, 13.4 lbs and 160 million gallons for the North Central lobe, and 5.6 lbs and 50.1 million gallons for the Southern lobe.

The CS-10 IP ETI system removed approximately 225.1 lbs of TCE and 15.4 lbs of PCE between January 2011 and December 2011 (**Table 12**). During this period approximately 1.04 billion gallons of groundwater were treated at the CS-10 IP treatment plants. A total mass of approximately 4,688.6 lbs of TCE and PCE has been removed by the CS-10 IP ETI system since startup in 1999.

The CS-10 Sandwich Road ETR system removed approximately 14.6 lbs of TCE and 0.7 lb of PCE between January 2011 and December 2011 (**Table 13**). During this period approximately 287 million gallons of groundwater were treated at the CS-10 SRTF from the CS-10 Sandwich Road ETR system and Southern Trench extraction well 03EW2112. A total mass of approximately 1,049 lbs of TCE and PCE has been removed by the CS-10 Sandwich Road ETR system since startup in 1999.

The Northern lobe extraction well removed approximately 51.9 lbs of TCE and 0.5 lbs of PCE between January 2011 and December 2011 (Table 14). During this period approximately 113 million gallons of groundwater were treated at the CS-10 SRTF from the Northern lobe extraction well. A total mass of approximately 347.7 lbs of TCE and PCE has been removed by the Northern lobe extraction well since startup in 2000.

In total, the CS-10 treatment systems processed approximately 1.4 billion gallons of contaminated groundwater and removed approximately 308.3 lbs of COCs in 2011. Approximately 6,085.4 lbs of COCs have been removed since startup. The operation of the CS-10 remedial systems used approximately 4,342 megawatt hours of electricity during 2011. Power plant air emissions associated with this power generation for 2011 and since system startup in 1999 are presented in Tables 15a and 15b for the CS-10 IP and SRTF, respectively. Green energy purchases and power production from AFCEE's wind turbines are incorporated into these air emission data.

The CS-10 remedial systems were operating under 2010 Scenario 01 pumping rates on 01 January 2011. On 19 January 2011, the CS-10 remedial systems were optimized to 2011 Scenario 01 operating conditions when Southern Trench extraction well 03EW2112 began operating at the optimized scenario (100 gpm and packered configuration). Using the most recent TCE plume shell (December 2007) for the main body of the CS-10 plume, and assuming these two systems will operate continuously at 2009 Scenario 01 pumping rates, groundwater transport modeling results indicate that by 2055 CS-10 IP and Sandwich Road extraction wells will no longer be contributing to plume cleanup and can be shut down. By 2055, one isolated area of contamination, located downgradient of IP extraction well 03EW2109, will remain essentially immobilized in a silt layer and will attenuate in place to concentrations below the MCL by 2094 (AFCEE 2009c).

Using the current Northern lobe plume shell (April 2005) and assuming the extraction well will operate continuously at 175 gpm; groundwater transport modeling results indicate that by 2030 the Northern lobe extraction well can be shut down and only two small areas of contamination, located upgradient of the Northern lobe extraction well, remain immobilized in a silt layer. Using the current plume shells for the North Central lobe and the Southern lobe (April 2005) groundwater transport modeling results indicate that concentrations in both these lobes will decrease below the MCL by 2025 (AFCEE 2005).

Through the SPEIM program, the Conceptual Site Model is routinely updated and the remedial system operation is continuously evaluated and optimized to reduce cleanup times, therefore the timeframes presented in the preceding section will most likely be decreased in future scenarios.

CS-10 SPEIM ACTIVITIES PLANNED FOR 2012

Activities currently planned for the CS-10 SPEIM program for 2012 include the following:

- Semiannual (July 2012) and biennial (November/December 2012) groundwater sampling.
- Semiannual extraction well sampling (June 2012 and November/December 2012).
- Monthly sampling of Sandwich Road extraction wells 03EW2176 and 03EW2177 (January 2012 through December 2012).
- ISCO sampling (March 2012 and September 2012).

- Seasonal recreational beach area surface water sampling (April 2012 and July 2012).
- Monthly treatment plant sampling (January 2012 through December 2012).
- Sampling of monitoring well 03MW2116A for MNA parameters (January 2012).
- Recording of daily average treatment system flow rates (January 2012 through December 2012).
- CS-10 SPEIM data presentations.
- LUC private well verification surveys and sampling (as needed).
- Complete sensitivity modeling to determine the appropriate CS-10 Sandwich Road reinjection scenario with 03EW2112 operating at 100 gpm and 03EW2176 and 03EW2177 operating at the interim flow rates of 75 and 50 gpm, respectively. Document the results in a project note submittal and implement the optimization.
- Complete the CS-10 data gap investigation, recalibrate the CS-10 groundwater flow model, and update the 2007 TCE plume shell. These results will be documented in a technical memorandum.
- Complete data gap investigation in area of Sandwich Road extraction wells 03EW2176 and 03EW2177.
- Groundwater flow and transport modeling will be used to evaluate optimization scenarios for the CS-10 IP and CS-10 Sandwich Road remedial systems.
- Optimize the CS-10 SPEIM monitoring network.
- Complete the evaluation of cyclical pumping at 03EW2110.
- Complete the field program and analysis for the alternative GAC pilot test and submit an evaluation report.

If you have any questions or comments, please contact Rose Forbes at (508) 968-4670, extension 5613.

Sincerely,

CH2M HILL

Patricia de Groot, P.G.
Program Manager

Data Source: AFCEE, February 2012, MMR-AFCEE Data Warehouse

Notes:

* Direct push boring location, samples collected during vertical profiling. Direct Push boring locations are presented on Figures 9 and 10.

** Extraction well screen length shortened through installation of packers as result of optimization.

Key:

bgs = below ground surface

ft = feet

msl = mean sea level

NA - not available

N/A = not applicable

Data Source: AFCEE, March 2012, MMR-AFCEE Data Warehouse

Notes:

Bold values indicate MCL exceedances.

MCLs from Environmental Protection Agency (EPA) web page, http://www.epa.gov/safewater/contaminants/index.html.

* - Extraction well 03EW2106 was taken out of operation in February 2010.

--: Sample collected through use of passive diffusion bag sampler or hydrasleeve sampler; water quality parameter collection not performed.

--*: Water quality parameters were not collected.

Key:

BRL = below the reporting limit
^{o}C = degrees Celsius
DO = dissolved oxygen
J = estimated result
MCL = Maximum Contaminant Level
mg/L = milligrams per liter
mV = millivolts
ND = not detected
NTU = nephelometric turbidity units
ORP = oxidation-reduction potential
PCE = tetrachloroethene
SpC = specific conductance
std = standard units
TCE = trichloroethene
Temp = temperature
µg/L = micrograms per liter
µS/cm = microsiemens per centimeter

Data Source: AFCEE, February 2012, MMR-AFCEE Data Warehouse

Notes:

BOLD values indicate an MCL exceedance.

NM[1] = water quality parameter collection at the midpoint sample port was omitted.

Water quality parameters (pH, temperature, DO, SpC, turbidity, and ORP) were measured semiannually at influent, post-GAC at each active GAC vessel, and plant effluent sampling locations. The measurements are taken using a flow-through cell and the Yellow Springs Instrument (YSI).

--: Water quality parameters were not collected.

Key:

BRL = below reporting limit
°C = degrees Celsius
DO = dissolved oxygen
MCL = Maximum Contaminant Level
mg/L = milligrams per liter
mV = millivolts
ND = not detected
NTU = nephelometric turbidity units
ORP = oxidation-reduction potential
PCE = tetrachloroethene
SpC = specific conductance
std = standard units
TCE = trichloroethene
Temp = temperature
Turb = turbidity
µg/L = micrograms per liter
µS/cm = microsiemens per centimeter

Data Source: AFCEE, February 2012, MMR-AFCEE Data Warehouse

Notes:

BOLD values indicate an MCL exceedance.

NM[1] = water quality parameter collection at the midpoint sample port was omitted.

Water quality parameters (pH, temperature, DO, SpC, turbidity, and ORP) were measured semiannually at influent, post-GAC at each active GAC vessel, and plant effluent sampling locations. The measurements are taken using a flow-through cell and the Yellow Springs Instrument (YSI).

--: Water quality parameters were not collected.

Key:

Optimized Design Flow Rate (gpm) (2011 Scenario 01)	460	300	230	450	N/A	50	125	250	425	380	678	1232
Percent of Optimized Design Rate	92	93	92	91	N/A	88	93	49	87	90	86	86

Data Source: AFCEE, February 2012, MMR-AFCEE Data Warehouse.

Notes:

Any downtime due to routine and non-routine operations and maintenance activities is included in the average flow rates.

Due to small-scale inaccuracies of the electronic flow rate meters, removal of relatively small amounts of water at the plant and use of operator log-book data (when electronic flow data is not available), the recorded influent rates may not equal the recorded effluent flow rates.

03EW2106 was taken out of operation on 24 February 2010.

* Began cyclic pumping test at 03EW2110 on 24 January 2011; cycling operation on a two-month frequency.

Key:

gpm = gallons per minute

N/A = not applicable

Data Source: AFCEE, February 2012, MMR-AFCEE Data Warehouse.

Notes:

Any downtime due to routine and non-routine operations and maintenance activities is included in the average flow rates.

Due to small-scale inaccuracies of the electronic flow rate meters, removal of relatively small amounts of water at the plant and use of operator log-book data (when electronic flow data is not available), the recorded influent rates may not equal the recorded effluent flow rates.

Reinjection wells 03RI2180, 03RI2181, and 03RI2182 were taken out of operation on 19 February 2009.

2011 Scenario 01 - 03EW2112 began operating at the optimized scenario (100 gpm and packered configuration) on 19 January 2011.

03 March 2011 - Continued flow testing at 00EW0001; increased flow rate from 190 gpm to 225 gpm.

Two off-line Sandwich Road extraction wells (03EW2176 and 03EW2177) were turned back on in 2011 after TCE MCL exceedances were observed in 03EW2177 (during sampling of off-line well).

* - 03EW2176 and 03EW2177 are operating at the interim flow rates of 75 and 50 gpm, respectively, to improve the hydraulic capture of the Sandwich Road ETR system.

Key:

gpm = gallons per minute

SD-5 = Storm Drain-5

N/A = not applicable

Table 11
CS-10 Treatment Plant Downtime Summary
CS-10 2011 Summary Letter Report

Date	Hours Off-Line	Reason
CS-10 In-Plume Treatment Plants		
12/30/2010	95.58	Bldg. A 03EW2105 and 03EW2107 off for carbon exchange Bldg. A CF101A.
1/4/2011	18.78	Rupture disc, frac cleanout and mini backwash on Bldgs. A, C, D. All differential pressures high.
1/5/2011	28.17	Systems at reduced flow and wells off to backwash all systems/ power blip and differential pressure trips.
1/19/2011	6.95	Plant tripped due to a vault flooded in 03EW2107 caused by the heavy rains that night.
1/24/2011	6.16	Shut off 03EW2111 to continue troubleshooting flow meter in vault.
1/27/2011	12.33	Loss of power and communications during storm. Start A, C, D with 03EW2102, 03EW2103, 03EW2104, 03EW2109,
1/27/2011	30.22	Bldg. B, 03EW2105 and 03EW2107. Base CE replaced fuses reset 03EW2105 surge and 03EW2107 Mod 30.
1/31/2011	48.00	Bldg. C and 03EW2105 off for a carbon changeout CF101A.
2/5/2011	32.47	Plant tripped off due to a power failure.
2/15/2011	15.50	Replaced ground wire on 03EW2111 flow meter.
2/17/2011	25.48	Carbon changeout Bldg. D CF101A and 03EW2105 off.
2/21/2011	24.58	Bldg. B and 03EW2105 off for a carbon changeout CF101B.
2/27/2011	26.20	Plant tripped due to a power failure.
3/1/2011	539.17	03EW2110 was shut off on 1/24 at 08:55 for 2 months/planned cyclic pump test.
3/29/2011	29.58	03EW2109 shut off to replace pump.
4/6/2011	24.33	Bldg. B, 03EW2107 and 03EW2111 off for carbon exchange CF101A.
4/13/2011	22.67	03EW2105 off due to a communications failure with the plant. Replace bad fiber modem.
4/22/2011	75.05	Bldg. C, 03EW2107 and 03EW2111 off for a carbon exchange CF101B.
5/17/2011	25.50	Bldg. A, 03EW2107 and 03EW2111 off carbon changeout CF101B.
5/24/2011	24.42	Bldg. B, 03EW2107 and 03EW2111 off for a carbon exchange CF101B.
6/9/2011	12.40	Plant tripped due to a power failure during the thunderstorms.
6/16/2011	3.67	Plant intentionally shut down for energy curtailment.
6/21/2011	25.50	Carbon changeout at Bldg. C CF101A.
7/8/2011	3.98	Systems and wells tripped during thunderstorm. Start Bldgs. A, C,D, 03EW2102, 03EW2103, 03EW2104, 03EW2107, 03EW2109. Bldg. B and 03EW2105 and 03EW2111 off.
7/8/2011	72.73	System B 03EW2105 and 03EW2111 off due to communications issue with 03EW2105 and 03EW2111.
7/8/2011	63.83	Plant tripped, 03EW2107 flooded. Restart with all wells on (replace bad fiber modem in 03EW2105 and reset 03EW2111).
7/14/2011	3.75	03EW2105 communications/ fiber modem/start Bldgs. A, B, C, D and all wells except 03EW2105 and 03EW2110.
7/14/2011	29.67	Bldg. B 03EW2107 off carbon changeout CF101A. Note: 03EW2105 already off.
7/15/2011	5.17	All systems and wells off to troubleshoot fiber optic and Mod 30 communications to O&M.
7/18/2011	14.52	Power during thunderstorm; 03EW2110 MOD 30 alarms cleared.
7/21/2011	25.83	Bldg. A 03EW2107 and 03EW2111 off for carbon changeout CF101A.
7/22/2011	65.67	Plant intentionally shut down for an energy curtailment.
7/22/2011	69.83	Bad starter an blown fuse on pole for 03EW2105. Replace starter/102nd replaced fuse on pole.
8/1/2011	10.17	Rupture disc Bldg. C. Note: Systems tripped on 7/30 at 13:00.
8/6/2011	37.57	Plant tripped due to a blown fuse on the pole feeding 03EW2105. Plant started with 03EW2105 and 03EW2107 off.
8/6/2011	46.15	Restart System B 03EW2105 and 03EW2107 after 102nd fixed blown fuse.
8/18/2011	7.42	03EW2106 started for sampling.
8/26/2011	73.25	Hurricane preparedness/ replace 1A1 mod 30/ 3 AI modules/ reset 03EW2111.
9/12/2011	25.08	Bldg. C 03EW2107 and 03EW2111 off carbon changeout CF101B.
9/19/2011	24.00	Bldg. B, 03EW2107 and 03EW2111 off for carbon changeout CF101B .
9/27/2011	24.75	Bldg. D, 03EW2107 and 03EW2111 off for carbon exchange CF101B Bldg. D.
9/29/2011	12.33	Plant tripped due to a power failure and 03EW2107 vault flooded during thunder storms.
10/2/2011	27.17	Plant tripped due to a power failure.
10/11/2011	3.25	Plant tripped due to low influent pressure.
10/13/2011	23.92	Bldg. B, 03EW2111 off for carbon exchange CF101A .
10/14/2011	2.92	Plant tripped off due to a power failure. Restart plant except for 03EW2111.
10/14/2011	97.92	03EW2111 off due to an issue resetting variable frequency drive. Note: Replaced 1A1 Mod 30.
10/15/2011	46.77	Plant tripped off due to a power failure. Restart plant except for 03EW2111 program issue.
10/24/2011	25.00	Bldg. A 03EW2107 and 03EW2111 off for carbon exchange CF101B.
11/6/2011	30.17	Power outage/ decant frac/ reset 03EW2111.
11/8/2011	2.03	03EW2105 off/ power blip/systems remained on and vessels needed to be bled.
11/16/2011	24.92	03EW2107 and 03EW2111 off for a carbon changeout Bldg. D CF101A.
11/20/2011	21.50	Power outage/decant frac/ reset 03EW2111.
11/28/2011	24.83	Bldg. B and 03EW2107 and 03EW2111 off for carbon exchange CF101B.
12/9/2011	72.58	Bldg. A, 03EW2107 and 03EW2111 off for carbon CF101A Bldg. A.
12/12/2011	13.67	Plant intentionally shut down for energy curtailment.
12/16/2011	77.25	Bldg. C, 03EW2107 and 03EW2111 off for a carbon changeout CF101A.
12/19/2011	2.50	Plant intentionally shut down for energy curtailment.

Table 11
CS-10 Treatment Plant Downtime Summary
CS-10 2011 Summary Letter Report

Date	Hours Off-Line	Reason
CS-10 Sandwich Road Treatment Plant (includes Northern Lobe Extraction Well)		
1/9/2011	23.37	Plant tripped off due to high differential pressure on greensand filters. High influent tank level.
1/14/2011	90.20	03EW2112 off until new pump motor installed for new flow rate.
1/25/2011	28.33	03EW2172 motor replacement.
1/27/2011	5.28	Power blip/low influent level during storm.
1/28/2011	122.58	03EW2177 shutoff while direct push drills in area.
1/29/2011	48.60	Power blip /low influent tank level.
1/28/2011	122.58	03EW2177 CS-10SR restarted after direct push drilling was completed.
2/2/2011	13.80	03EW2174 tripped off due to a flooded vault caused by heavy rain/snow melting.
2/6/2011	29.85	Plant tripped due to a power failure. CS-10SR 03EW2174 also vault flooded.
2/6/2011	32.85	CS-10SR 03EW2173 vault flooded due to heavy rains.
2/19/2011	42.92	Power outage/ start from O&M control.
2/26/2011	51.90	Plant tripped off due to a power failure.
3/15/2011	43.83	00EW0001 off replacing pump/motor.
4/13/2011	26.75	CS-10SR 03EW2175 transformer blown. Well at design flow but not reading it.
4/17/2011	29.33	Power failure caused effluent pump to trip. CS-10SR wells off due to power failure, Northern lobe well on.
5/5/2011	147.08	03EW2177 off for Direct Push drilling.
5/10/2011	7.58	03EW2112 shut down for gas main replacement on Currier Road.
5/11/2011	7.67	03EW2112 shut down for gas main replacement on Currier Road.
5/12/2011	6.33	03EW2112 shut down for gas main replacement on Currier Road.
5/19/2011	11.95	00EW0001 tripped/ power blip/replace disconnect.
6/5/2011	22.17	00EW0001 off power failure/reset in well vault.
6/6/2011	101.25	03EW2177 shut off for rotosonic drilling next to well.
6/16/2011	2.67	Plant intentionally shutdown for energy curtailment Note: 00EW0001 started in vault at 15:45.
6/16/2011	10.17	No greensand filter running.
7/8/2011	58.17	Plant tripped off due to a power failure.
7/9/2011	269.83	03EW2177 CS-10SR left off for direct push drilling.
7/18/2011	14.42	power outage during thunder storm/ reset backplane through VIZAPP.
7/20/2011	194.42	03EW2177 off for direct push drilling.
7/22/2011	65.50	Plant intentionally shut down for energy curtailment.
8/11/2011	4.88	Plant tripped due to no greensand filters running due to high differential pressures.
8/13/2011	43.63	CS-10SR wells tripped off due to a power failure.
8/26/2011	63.58	Hurricane preparedness.
9/29/2011	11.00	Plant tripped due to a power failure during the thunderstorms.
10/2/2011	22.67	Plant tripped off due to a power failure. 00EW0001 off.
10/2/2011	24.25	00EW0001 restarted from the well. Starter had to be reset.
10/3/2011	2.33	00EW0001 tripped due to a power blip.
10/13/2011	2.07	00EW0001 restarted from the well. Starter had to be reset.
10/15/2011	46.20	Plant tripped off due to a power failure. CS-10SR 03EW2171, 03EW2174, and 03EW2177 remained offline due to bad backplane.
10/15/2011	48.70	Replace bad backplane and restart CS-10SR 03EW2171, 03EW2174, and 03EW2177.
10/18/2011	3.92	00EW0001 tripped due to a power blip.
10/21/2011	7.00	00EW0001 tripped due to a power blip .
10/21/2011	57.30	00EW0001 tripped due to a power blip.
11/3/2011	4.75	Power outage.
11/8/2011	2.20	Power outage.
11/8/2011	16.25	03EW2174 and 03EW2177 tripped/ blown fuse in PLC cabinet.
11/20/2011	18.42	Power outage.
12/12/2011	13.67	Plant intentionally shut down for energy curtailment.
11/3/2011	964.33	03EW2171 CS10SR off due to a bad starter and well motor.
12/19/2011	2.50	Plant intentionally shut down for energy curtailment.

CS-10 In-Plume Remedial System Electrical Consumption and Associated Air Emissions
CS-10 2011 Summary Letter Report

		1/1/2011 to 12/31/2011	System Startup (6/1999) to 12/31/2011
Volume of Groundwater Treated (million gallons)		**1,035**	**15,706**
Groundwater COC Mass Removal (pounds)		**241**	**4,689**
Electrical Usage (MWh)		**2,850**	**39,043**
Estimated Air Emissions[1] (based on electrical usage)	**CO_2 (tons)**	1,867	30,488
	NOx (lbs)	4,019	48,997
	PM-10 (lbs)	230	1,831
	SO_2 (lbs)	10,716	59,732
	VOCs (lbs)	141	2,166
Estimated Reduction in Air Emissions due to Green Power Purchases[2]	**CO_2 (tons)**	0	0
	NOx (lbs)	0	0
	PM-10 (lbs)	0	0
	SO_2 (lbs)	0	0
	VOCs (lbs)	0	0
Estimated Reduction in Air Emissions due to MMR Wind Turbine Operation[3]	**CO_2 (tons)**	880	1213
	NOx (lbs)	1894	2612
	PM-10 (lbs)	108	149
	SO_2 (lbs)	5051	6965
	VOCs (lbs)	66	91
Estimated Total Air Emissions with consideration of Green Power Purchases and MMR Wind Turbine Operation	**CO_2 (tons)**	**987**	**29,275**
	NOx (lbs)	**2,124**	**46,385**
	PM-10 (lbs)	**122**	**1,681**
	SO_2 (lbs)	**5,665**	**52,767**
	VOCs (lbs)	**74**	**2,075**

Notes:

1) The estimated air emissions presented in this table are based on the assumption that until 4/30/2009, the power used to operate the MMR remedial systems was provided by the Mirant Canal Station power plant in Sandwich, MA. This power plant primarily produced electricity generated by the combustion of fuel oil and has been off-line since 5/1/2009. Starting on 5/1/2009, air emissions are based on electricity generated by the average mix of power sources in Massachusetts. Air emissions were calculated using MMR utility data from AFCEE's Metrix 4 Utility Accounting Software (http://www.abraxasenergy.com/metrix4.php) and emission factors obtained from the following websites:
http://www.csgnetwork.com/elecpowerpolcalc.html
http://www.metrixcentral.com/EmissionsCalculator/Emissions%20Factors%202004.pdf
2) Option to purchase electricity from renewable sources is not available for CS-10 In Plume accounts.
3) Emissions offset by operation of AFCEE-owned wind turbines beginning on 12/2/2009 (Wind I) and 11/1/2011 (Wind II).

Key:
COC = contaminant of concern
CO_2 = carbon dioxide
CS-10 = Chemical Spill-10
lbs = pounds
MMR = Massachusetts Military Reservation
MWh = megawatt hours
NO_x = nitrogen oxides
PM-10 = particulate matter with a diameter of 10 micrometers or less
SO_2 = sulfur dioxide
VOCs = volatile organic compounds

Comparison of Detected Concentrations in CS-10 Groundwater and Treatment Plant Samples to Applicable Standards
Chemical Spill-10 2011 Summary Letter Report

Location	Sample Date	Sample Elevation (ft msl)	Matrix	Test	Analyte	Result	DL	RL	Standard	Type[1,2,3]	Standard Exceeded?
						All units - µg/L					
USSD517139	1/7/2011	-59.02	WG	SW8260B	TETRACHLOROETHENE (PCE)	BRL	0.19	1	5	MCL	No
USSD517139	1/7/2011	-59.02	WG	SW8260B	TRICHLOROETHENE (TCE)	9.6	0.2	1	5	MCL	Yes
USSD518139	1/7/2011	-66.57	WG	SW8260B	TRICHLOROETHENE (TCE)	2.8	0.2	1	5	MCL	No
USSD518139	12/8/2011	-66.57	WG	SW8260B	TRICHLOROETHENE (TCE)	BRL	0.2	1	5	MCL	No

Data Source: AFCEE, March 2012, MMR-AFCEE Data Warehouse

Notes:

1. MCLs from Environmental Protection Agency (EPA) web page,http://water.epa.gov/drink/contaminants/.
2. MMCLs and ORSGs from Massachusetts Department of Environmental Protection (MassDEP) web page, http://www.mass.gov/dep/water/dwstand.pdf.
3. The calculated hazard equivalent concentration (HEC), based on a hazard index equal to 1, for 1,2,4-trimethylbenzene (TMB) and 1,3,5-TMB is 17 µg/L.
4. Detections of tert-butyl methyl ether (MTBE), chloromethane, and the trihalomethanes (chloroform, bromodichloromethane, dibromochloromethane, and bromoform) are not included because they are not considered MMR plume-related compounds.

Key:

BRL = below reporting limit
DL = detection limit
J = estimated value
MCL = Maximum Contaminant Level
MMCL = Massachusetts MCL
NA = not available
N/A = not applicable
ORSG = Office of Research and Standards Guideline (MassDEP)
RL = reporting limit
WA = borehole water
WG = groundwater sample
WW = plant water
µg/L = micrograms per liter

Data Source: AFCEE, March 2012, MMR-AFCEE Data Warehouse

Key:

BOS = bottom of sample
BRL = below reporting limit
CS-10 = Chemical Spill-10
ft bgs = feet below ground surface
ft msl = feet mean sea level
FS-13 = Fuel Spill-13
MCL = Maximum Contaminant Level
ND = not detected
PCE = tetrachloroethene
TCE = trichloroethene
TMB = trimethlybenzene
TOS = top of sample
µg/L = micrograms per liter

Notes:

Ground surface elevation is approximately 130 ft msl.

Bold value indicates an MCL exceedance.

* Other fuel related contaminants (ethylbenzene, toluene, and xylenes) were detected in the B and Q sample intervals at low level (sub-MCL concentrations).

Rig refusal was at 246 ft bgs (-116 ft msl).

Data Source: AFCEE, March 2012, MMR-AFCEE Data Warehouse

Key:

BOS = bottom of sample
BRL = below reporting limit
ft bgs = feet below ground surface
ft msl = feet mean sea level
MCL = Maximum Contaminant Level
NA = not applicable
ND = not detected
NS = not sampled
PCE = tetrachloroethene
TCE = trichloroethene
TOS = top of sample
µg/L = micrograms per liter

Notes:

Ground surface elevation is approximately 146 ft msl.
Bold value indicates an MCL exceedance.
Bottom of boring was at 284.5 ft bgs (-138.5 msl).

Data Summary Report
Chemical Spill-10 2011 Summary Letter Report

INTRODUCTION

The objective of this data summary report (DSR) is to assess the data quality of analytical results for samples collected for the Chemical Spill-10 System Performance and Ecological Impact Monitoring (SPEIM) Program at the Massachusetts Military Reservation (MMR) as presented in the *Chemical Spill-10 2011 Summary Letter Report*. This report is intended as a general data quality assessment designed to summarize data issues.

ANALYTICAL DATA

This DSR covers 765 borewater samples with 45 field duplicate samples, 486 groundwater samples with 14 field duplicate samples, seven surface water samples with one field duplicate sample, 62 soil samples, and 231 plant samples. Field duplicates are not required for soil samples and treatment facility plant samples. These samples were reported under 395 sample delivery groups. Samples were collected between 03 January 2011 and 11 January 2012. The analyses were performed by Analytics Environmental Laboratory LLC (ANAP) in Portsmouth, New Hampshire, Groundwater Analytical (GWAB) in Buzzards Bay, Massachusetts, Alpha Analytical (ALPW) in Westborough, Massachusetts, Alpha Analytical (ALPM) in Mansfield, Massachusetts, and TriMatrix Laboratories (TMLG) in Grand Rapids, Michigan. Samples were collected and shipped by overnight carrier or delivered by courier to ANAP, ALPW, and ALPM; delivered by courier to GWAB, and shipped by overnight carrier to TMLG for analysis. Samples were analyzed for the analytes/methods provided in Table C-1.

Table C-1
Analytical Parameter

Parameter	Method	Laboratory
1,2-Dibromoethane (Ethylene Dibromide)	E504.1	ANAP
Volatile Organic Compounds (VOC)	SW8260B	ANAP
Screening Data VOCs	Modified SW8260B	ANAP, GWAB
Dissolved Chromium and Manganese	SW6010B	ALPW

Data Summary Report
Chemical Spill-10 2011 Summary Letter Report

Table C-1
Analytical Parameter

Parameter	Method	Laboratory
Hexavalent Chromium	SW7196A	ALPW
Total Dissolved Solids	SM2540C	ALPW
Total Organic Carbon (TOC) in soil	SW9060	ALPM
TOC in soil	Walkley Black	TMLG

E = Environmental Protection Agency (EPA) Method
SW = SW 846 Test Methods for Evaluating Solid Waste, 3rd Edition, Revision 4, 1996
SM = Standard Methods for the Examination of Water and Wastewater, 18th, 19th, or 20th editions, 1992, 1995, 1998

The data were assessed using the MMR SPEIM Quality Assurance Project Plan (QAPP)[1]. The assessment included a review of the following:

- Chain-of-Custody documentation
- Holding time compliance
- Required quality control (QC) samples at the specified frequencies
- Method blanks
- Laboratory control spiking samples
- Surrogate spike recoveries
- Internal standards
- Matrix spike/matrix spike duplicate (MS/MSD) samples on a site/location basis
- Initial and continuing calibration information and other method-specific criteria as defined by the SPEIM QAPP

Field samples were reviewed to ascertain field compliance and data quality issues. This included a review of trip blanks, equipment blanks, and field duplicates.

[1] AFCEE. 2011 (August). *Quality Assurance Project Plan for the MMR SPEIM/LTM/O&M Program*. 404929-Program-Multiple-QAPP-001. Prepared by CH2M HILL for AFCEE/MMR Installation Restoration Program, Otis Air National Guard Base, MA.

Data were carried through data validation as described in the SPEIM QAPP and data flags were assigned according to the SPEIM QAPP. These flags, and the reason for each flag, were entered into the electronic database and can be found in Table C-2 (located at the end of this attachment). Multiple flags are routinely applied to specific sample method/matrix/analyte combinations, but there is only one final flag. A final flag is applied to the data, and is the most conservative of the applied validation flags. The final flag also includes matrix and blank sample impacts.

The data flags are listed in the SPEIM QAPP and are defined as follows:

- J = Analyte was present but the reported value may not be accurate or precise (estimated).
- R = Analyte result was unusable due to deficiencies in the ability to analyze the sample and meet QC criteria.
- U = Analyte was not detected at the specified detection limit.
- UJ = Analyte was not detected and the specified detection limit may not be accurate or precise (estimated).
- S = Analyte was reported from the modified method SW8260B for screening data volatile organic compounds. The result is considered an estimated value.

FINDINGS

The summaries of the data validation findings are contained in the following subsections and Table C-2.

Holding Times

All holding-time criteria were met.

Calibration

Initial and continuing calibrations were analyzed as required in every analytical batch and were in control overall with the following exception.

Bromomethane was recoveried below the lower control limit for the continuing calibration verification standard for method SW8260B. Six associated non-detected sample results were qualified as estimated and flagged “UJ”.

Method Blanks

Method blanks were analyzed at the required frequency for each method.

1,2,4-Trimethylbenzene, bromomethane, tetrachloroethene, and toluene were detected in laboratory blanks less than the reporting limit (RL) for method SW8260B. One 1,2,4-trimethylbenzene detected result, one bromomethane detected result, one tetrachloroethene detected result, and two toluene detected results were flagged “U”.

TOC was detected in laboratory blanks less than the RL for the Walkley Black method. Ten TOC detected results were were qualified as not detected and flagged “U”.

Field Blanks

Trip blanks and equipment blanks were collected and analyzed at the required frequency.

Chloroform was detected in equipment blanks above the RLs for methods SW 8260B and modified SW8260B. Seven chloroform detected results for SW8260B were qualified as not detected and flagged “U”. One chloroform result for modified SW8260B was qualified as not detected and flagged “US”. 1,2,4-Trimethylbenzene, bromomethane, chloromethane, trichloroethene were detected in trip blanks below than the RL for method SW8260B. One 1,2,4-Trimethylbenzene, one bromomethane, 21 chloromethane, and one trichloroethene detected results were flagged “U”.

Field Duplicates

Field duplicates were collected as required, and precision was acceptable overall. cis-1,2-Dichloroethene and trichloroethene exceeded field duplicate relative percent difference (RPD) criterion in one field duplicate pair for method SW8260B. Two cis-1,2-dichloroethene and two trichloroethene detected results were qualified as estimated values and flagged "J".

Matrix Spike Samples

MS/MSDs were collected at the required frequency and provided overall acceptable accuracy and precision. trans-1,2- Dichloroethene was recovered below the lower control limit in the MS for one sample for method SW8260B. The parent sample non-detected results was flagged "UJ".

Tetrachloroethene exceeded the MS RPD criterion for one sample for method SW8260B. The parent sample non-detected result was qualified as an estimated value and flagged "UJ".

Surrogates

Surrogate recoveries met each method SPEIM QAPP criteria overall. Four samples had surrogate recoveries greater than the upper control limit for method SW8260B. Five detected results were qualified as estimated and flagged "J".

Laboratory Control Samples

Laboratory control sample/laboratory control sample duplicates (LCS/LCSD) were analyzed as required and were generally in control. The LCS recoveries for cis-1,2-dichloroethene and tetrachloroethene were greater than the upper control limit for method SW8260B. One cis-1,2-dichloroethene detected result and two tetrachloroethene detected results were flagged "J".

The LCS recoveries for trans-1,2-dichloroethene was less than the lower control limit for method SW8260B. Thirty-five trans-1,2-dichloroethene non-detected results were flagged "UJ".

Laboratory Duplicate Samples

One TOC soil sample did not meet laboratory duplicate criterion for method SW9060. The TOC detected sample result was qualified as estimated and flagged "J".

Confirmation Results

Confirmation samples were analyzed as required by method E504.1. No confirmation flags were applied.

Internal Standards

Internal standards were in control. No internal standard flags were applied.

Chain of Custody

No chain of custody anomalies were noted in the review.

Overall Assessment

The goal of this assessment is to demonstrate that a sufficient number of representative samples were collected and the resulting analytical data can be used to support the decision-making process. The procedures for assessing the precision, accuracy, representativeness, completeness, and comparability parameters (PARCC) are addressed in the SPEIM QAPP. The following summary highlights the PARCC findings for the above-defined events:

1. The completeness goal for valid usable data is 95 percent for aqueous samples and 90 percent for solid samples. Completeness for aqueous and soil samples was 100 percent. The completeness goal was met for all compounds.

2. The routinely acceptable performance of field and laboratory QC indicators (field duplicates, field blanks, laboratory blanks, MS/MSDs, surrogate spikes, LCS, and calibrations) generally shows that the precision and accuracy of the data met project objectives.

3. Sample results are representative and comparable to field conditions and past historical data because the field sampling and laboratory analyses were performed using standardized and documented procedures as defined in project documents. In addition, all results were reported with industry standard units. A minimum number of sample results were qualified due to blank contamination. Blank concentrations were relatively low in relation to the RL and overall, reflect normal laboratory and field operating conditions.
